This map shows the potential for hydro energy production considering:
- Statewide analysis of solar potential
- Statewide, Regional and Local constraints which prevent or may impact development of solar energy generation facilities

Potential hydro electric generation sites were identified by using existing dam location data for all of Vermont and then estimating electric production. Estimating is an inexact science, and estimates can vary wildly between different studies. For more info see [see website](http://publicservice.vermont.gov/info.com/hydro/methodology) for information about methodology.
